Apk google chrome pc

Chrome 69, which marks the browser's 10th anniversary, is a huge version. The new smooth theme is the most visible change, but there are more new features. For example, you can now customize Chrome's New Tab page with custom background images and shortcuts. New theme Hardware Design You'll know you're using the new Chrome because you'll see a new theme after it's updated. Things work mostly the same way, although there is a new profile icon near the menu bar. You can click on it to see information about the Google account you're signed into with, view saved passwords, and manage payment methods and addresses for auto-filling. On Windows 10, you can make Chrome's grey tab bar more colorful by activating the colorful title bars, if you wish. If you don't like the new theme at all, there's a hidden flag that will reactivate Chrome's old design. Google will probably remove this option eventually, but it will allow you to continue using this familiar design for a longer time. RELATED: Make Chrome Look Normal Again With This Hidden Option Colorful Backgrounds for the New Tab Page Now allows you to select any background image you want without first installing a browser extension. To set a custom background, click on the speed icon in the bottom right corner of the new tab page. Select chrom background shots to choose one of Google's backgrounds, or click upload an Image to put any background image you like there. The custom shortcuts on the New Chrome tab page previously had a most visited section under the search area, showing you which web pages you visited most frequently. Here we go. Instead, the New Tab page allows you to choose the shortcuts that appear under the search area. You can click the Add a Shortcut button to add shortcuts to your favorite websites. You can also rename or delete one of the existing shortcuts. Just fly over one of them and click the menu button that appears in the top right corner of the icon to access the options. This feature might use a little more work — for example, we'd like to be able to swipe and drop these shortcut icons to rearrange them — but the customization is nice. Password generator and autofill chrome enhancements has had a password manager for a long time, but it just improved a lot. Chrome can now automatically generate and save random passes for you. Click the right button on a password field and select Generating a password. This feature was previously available but hidden. We recommend password managers to everyone, but most people probably won't install a password manager like LastPass. Chrome has a better chance of bringing password managers to the masses, making it easier for everyone to use strong and unique passwords everywhere. Google has also improved Chrome's auto-filling feature. The browser should be better at filling out passwords with credit card numbers and addresses. RELATED: Chrome 69 generates strong passwords for new online accounts Omnibox powers Chrome's address bar, as Google Google Google Omnibox, which has just become more powerful. Many search responses now appear instantly in the Omnibox when you start typing, just as they do when searching on Google's website. For example, you can type time in the Omnibox to see the weather right there in the box. Other types of responses that Google knows should appear here too, including translations of foreign words, details about sporting events, and celebrity information. Google promises that the Omnibox will search for your Google Drive files soon, too. The Omnibox now makes it easy to switch from tabs to each other. For example, if Gmail is open and type Gmail into the Omnibox, Google will offer to switch to your open Gmail tab instead of opening a new one. This is a great feature for anyone who loves keyboard navigation or just has too many open tabs. Easy access to search on Chrome's mobile apps for Android, iPhone and iPad has also just got an update with a new theme and layout. The navigation bar now appears on the bottom of the screen, making it easier to use with one hand, even if the phones keep getting bigger and bigger. There is also a new search button smack dab in the middle of this lower navigation bar, making it easier to start new searches, especially one hand. The Secure indicator is gone It's a minor change you may not notice, but Chrome just dropped the green lock icon and the Secure indicator from HTTPS sites. You'll always see a gray lock icon in the Omnibox on secure websites, but that's it. This follows another recent change: Chrome branded all standard HTTP websites as unsecured. Websites are secure by default, unless Google Chrome tells you otherwise. In the future, Google will even get rid of this little gray lock icon. RELATED: Chrome 69 No Longer Says Websites are secure (even if they are) An Easter Egg in a Chrome Easter Egg Dinosaur Game receives a temporary visual upgrade, too. This is an Easter egg, and it appears when you don't have an Internet connection. On the No Internet page, which has a dinosaur icon, tap the space bar (or tap mobile) to start the game. You play a dinosaur running through a desert, and you have to jump over the cacti. It's not going to win prizes, but it's something to do while you wait for the internet to come back. For September 2018, this game now offers a birthday cake that the dinosaur can eat, giving it a festive hat. There are also balloons Background. It's like an Easter egg inside an Easter egg. Bonus: Chrome's Had a Built-in Adblocker Since February While Chrome 69 offers a significant visual change, Google updates Chrome every six weeks with new features, security updates and bug fixes. Previous versions of Chrome have had some big changes, too. The most important thing you should know is Chrome's built-in adblocker. Chrome now automatically blocks ads on websites that use odious ads like auto-play videos with audio and huge banners that block your screen. This You have a better browsing experience if you use Chrome, and it provides websites with a strong incentive to display better ads to everyone. It's automatically activated, and you don't have to do anything or even think about it. This change returned on February 15, 2018, but it is easy to miss. It just silently makes the web better. By Kevin Lee Many files find their way to your hard drive after downloading and installing the Google Home browser. The Chrome installation file isn't that big, but the files created by the browser can vary in size. This file-creation process continues behind the scenes as you browse the web, download content and perform other activities. Discover the disk space Chrome used to manage your personal data by taking a look at the folder that contains this information. Google releases new versions of Chrome about every six weeks. As the company adds new features to the browser, the size of installation files may change. If you visit the Chrome download web page and click Accept and install, a dialogue window opens that allows you to save the file. It also shows the size of the file. At the date of publication, the size of version 23.0.1271.64 m is 30.3 MB. If you have a slow dial-up connection and want to download the file quickly, consider using a computer with a faster broadband connection. You can then save it to an external drive and install it on your own computer. When you install Chrome, it creates a user data folder that collects and manages your personal information. The Bookmarks file in this folder grows as you visit websites and record bookmarks. Although bookmark entries are small, the Signet file can become large when you mark hundreds or thousands of sites. Chrome also uses more disk space if you choose to create additional user profiles. Each profile you create keeps its own set of files that contain the personal settings of the profile. The Chrome User Data folder also keeps files that grow and shrink as you browse the web. Websites, for example, often store tiny bits of data called cookies on your hard drive. The user data directory contains these cookies as well as the file that contains your browsing history. Your browsing history increases as you browse the web until you clear up the history by clicking on the Chrome menu, clicking History, and then clicking navigation data. Search for your user data directory by opening the Windows Explorer and navigating to the C:-Users folder. Click on the ptaTa folder to reveal the Local folder, then click on the locate folder to reveal the Google folder. Click on this folder to view the Chrome folder, then click on this folder that reveals the User Data folder. This folder contains a separate sub-file for each Chrome profile. Unless you create an additional profile, the folder contains a profile folder named By default. If you click the right button on this folder and select Properties, you can see the size of the folder in the Properties window that opens. You may need to type File Options into Start menu and tap nter if you can't find the AppData folder; The file can be hidden. After pressing Entry, then clicking Show, a radio button called Show Hidden Files, Files, and Reader. Click this radio button to select it if you want to make the hidden files visible. This allows you to find your Chrome User Data folder. Folder.
